

The term “mitigation” describes actions which can help reduce or eliminate your long-term risk from natural disasters. With mitigation, you can avoid losses and reduce your risk of becoming a disaster victim.

There are many low-cost mitigation measures you can take to protect yourself, your home, or your business from losses. For example:

FLOODING

- Move valuables and appliances out of the basement of your home or business if it is prone to flooding. This will increase the chance that your belongings will remain dry when a flood occurs.
- Have the main breaker or fuse box and the utility meters elevated above the anticipated flood level in your home or business, so that flood water won't damage your utilities.
- Buy flood insurance to cover the value of your home and its contents. Not only will it give you greater peace of mind, but it will also greatly speed your recovery if a flood occurs. To learn more about flood insurance, contact your insurance company or agent, or call 1-800-427-4661.

EARTHQUAKES

- Bolt or strap cupboards and bookcases to the wall, and keep heavy objects on the lower shelves. This will reduce both damages and the possibility of injury to those in your home or business.
- Strap your water heater to a nearby wall using bands of perforated steel (commonly known as “plumber’s tape”). If a gas water heater falls during an earthquake, it could break the gas line and start a fire.
- Install bolts to connect your home to its foundation. Anchor bolts cost as little as \$2 a piece, but can prevent thousands of dollars of damage. Have them installed every six feet around the perimeter of your home.

HURRICANES AND TORNADOES

- Have hurricane straps installed in your home or business to better secure the roof to the walls and foundation. This will reduce the risk of losing your roof to high winds.
- Install and maintain storm shutters to protect all exposed windows and glass surfaces, and use them when severe weather threatens. Besides protecting against wind, shutters also prevent damage from flying debris.
- Have your home inspected by a building professional to ensure that roof and other building components are capable of withstanding wind effects.

WILDFIRES

- Move shrubs and other landscaping away from the sides of your home or deck. All too often, homes burn when plantings around them catch fire.
- Install tile or flame-retardant shingles on your roof, instead of wood shakes or standard shingles. This will reduce the chance that airborne burning debris will end up destroying your home.
- Clear dead brush and grass from your property so that it will not provide fuel for a spreading fire.

MAKE SURE TO MITIGATE PROPERLY — THE FIRST TIME!

Most communities have building codes and ordinances which guide construction practices. Many of these are designed to reduce your risk from all types of hazards, including floods, earthquakes, high winds, and wildfires.

If you have any questions about local codes or ordinances, and how they may impact mitigation efforts in your home or business, contact a professional or your building official. Either should be able to provide you with the assistance you need to mitigate right the first time.

Mitigation Begins
